

AWS CloudWatch Logs

- CloudWatch Logs can use filter expressions
- Logs storage architecture:
 - Log groups: arbitrary name, usually representing an application
 - Log stream: instances within application / log files / containers
- Can define log expiration policies (never expire, 30 days, etc..)
- Using the AWS CLI we can tail CloudWatch logs
- To send logs to CloudWatch, make sure IAM permissions are correct!
- Security: encryption of logs using KMS at the Group Level
