

# Function `Fn::Sub`

- `Fn::Sub`, or `!Sub` as a shorthand, is used to substitute variables from a text. It's a very handy function that will allow you to fully customize your templates.
- For example, you can combine `Fn::Sub` with References or AWS Pseudo variables!
- **String** must contain `${VariableName}` and will substitute them

```
!Sub
- String
- { Var1Name: Var1Value, Var2Name: Var2Value }
```

```
!Sub String
```
